SOMMAIRE

Contexte

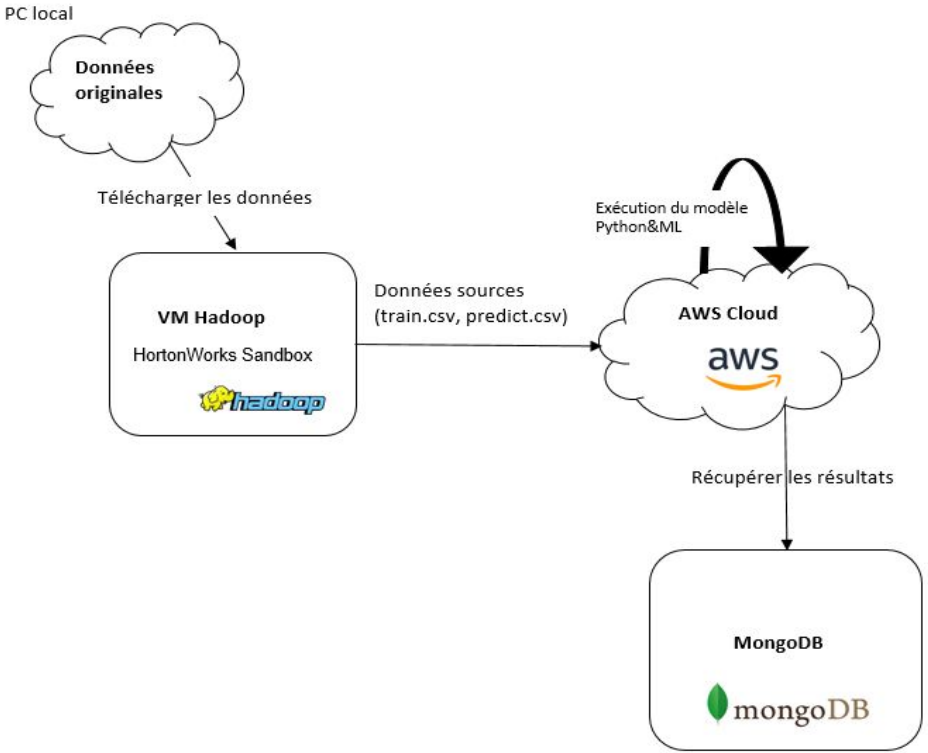
But de l’entreprise d’assurance :

Présentation des données

- 2 set de données :
- un set de prédiction
- un set de train

- 129 caractéristiques par individu

Présentation et interprétation du sujet



Créer des dossiers et modifier les autorisations des utilisateurs

```
[root@sandbox-hdp ~]# sudo -u hdfs hadoop dfs -chown admin:hdfs /input
WARNING: Use of this script to execute dfs is deprecated.
WARNING: Attempting to execute replacement "hdfs dfs" instead.

[root@sandbox-hdp ~]# sudo -u hdfs hadoop fs -chmod 777 /input
[root@sandbox-hdp ~]# hadoop fs -ls /

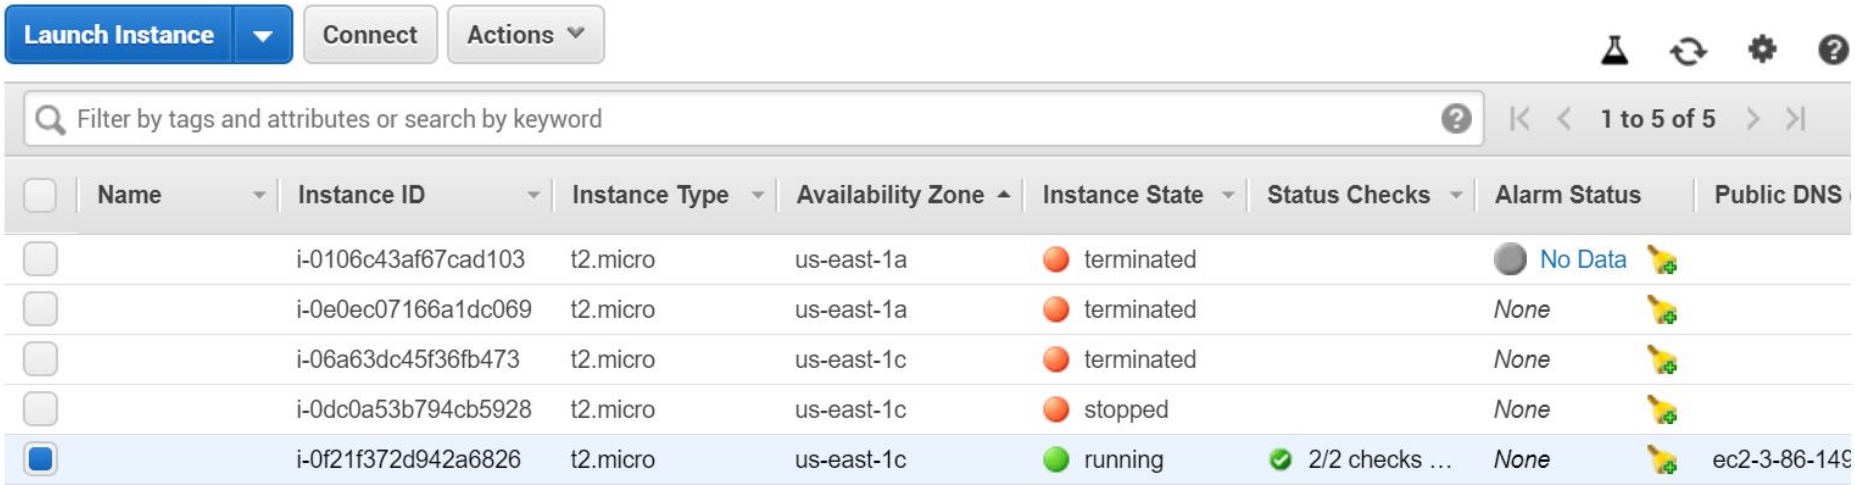
predict.csv  train.csv
```

2ème partie:

Cloud

AWS

Création de l’instance de EC2



Téléchargement du fichier resultats.csv sur le FileSystem de la VM AWS

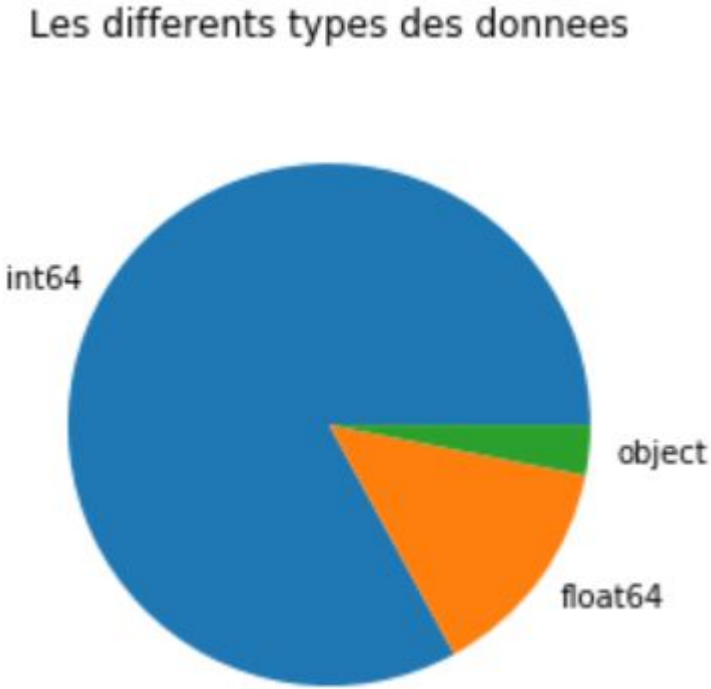
```
[root@sandbox-hdp ~]# ls
anaconda-ks.cfg  dead.letter  hadoop.pem  predict.csv  train.csv  ubuntu-AWS.pem
[root@sandbox-hdp ~]# scp -i hadoop.pem ec2-user@ec2-18-234-56-202.compute-1.amazonaws.com:results.csv ./
results.csv                                                                                   100%    0     0.0KB/s   00:00
[root@sandbox-hdp ~]# ls
anaconda-ks.cfg  dead.letter  hadoop.pem  predict.csv  results.csv  train.csv  ubuntu-AWS.pem
[root@sandbox-hdp ~]#
```

3eme partie:

Analyse des données

Les différents types de données:

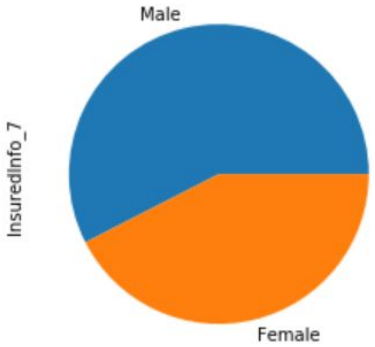
Nombre des lignes: 58881
Nombre des colonnes:129



➡ **Pour les caractéristiques de type objet, nous avons besoin d'utiliser la numérisation.**

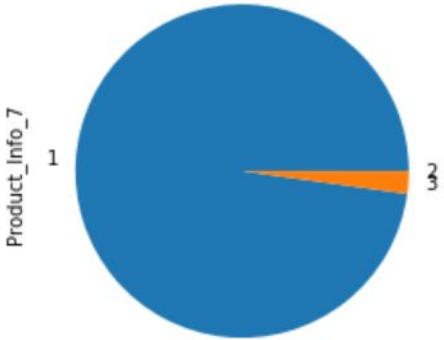
Analyse des variables

Les 2 sexes:



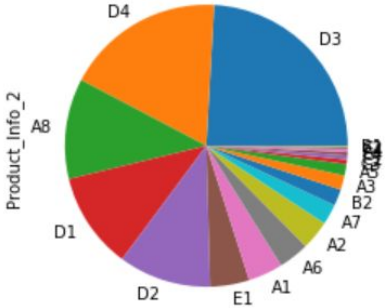
Male	0.575279
Female	0.424721

Le types de produits_7:

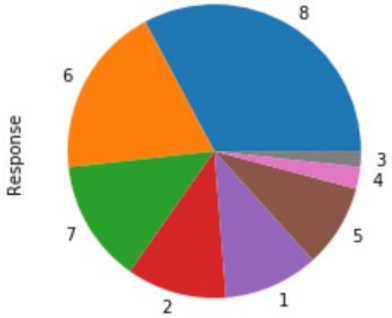


Type de prosuit_7	Le taux
1	**0.978142**
2	**0.021824**
3	**0.000034**

Les types de produit_2:

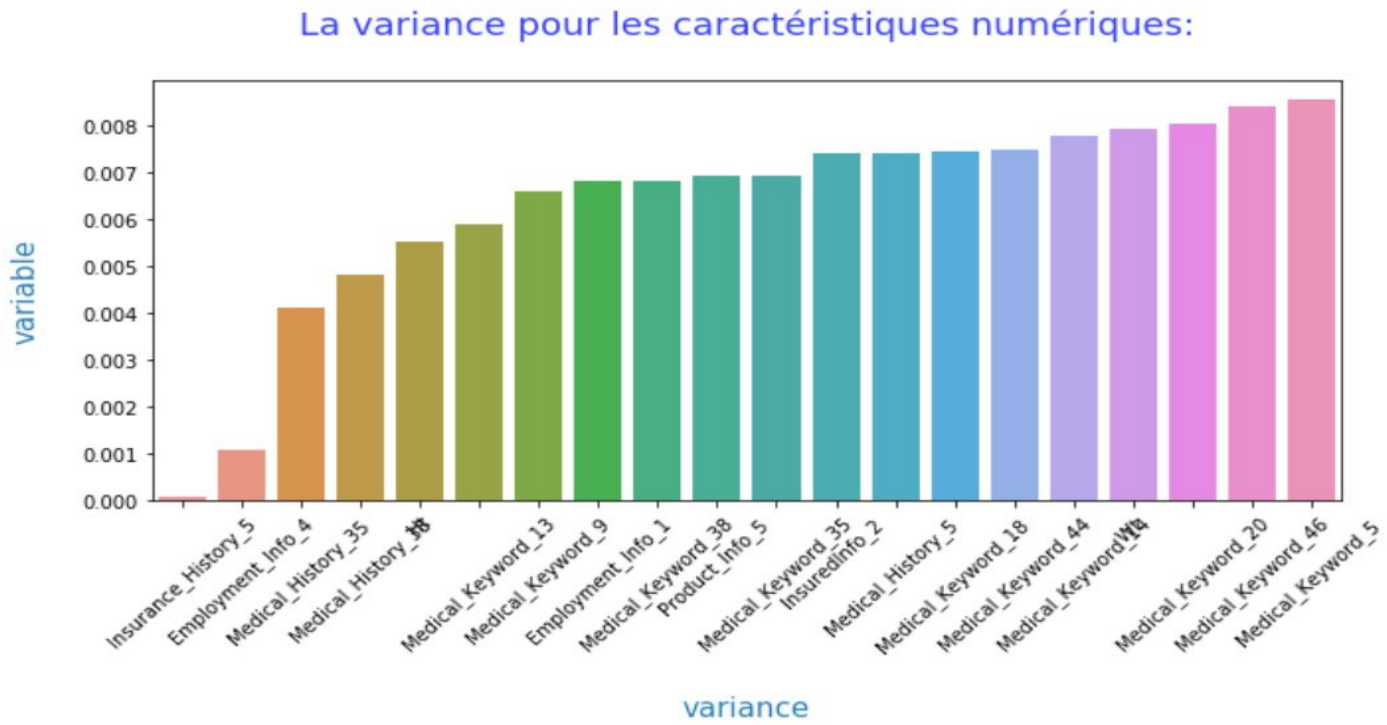


Le niveau de risque:

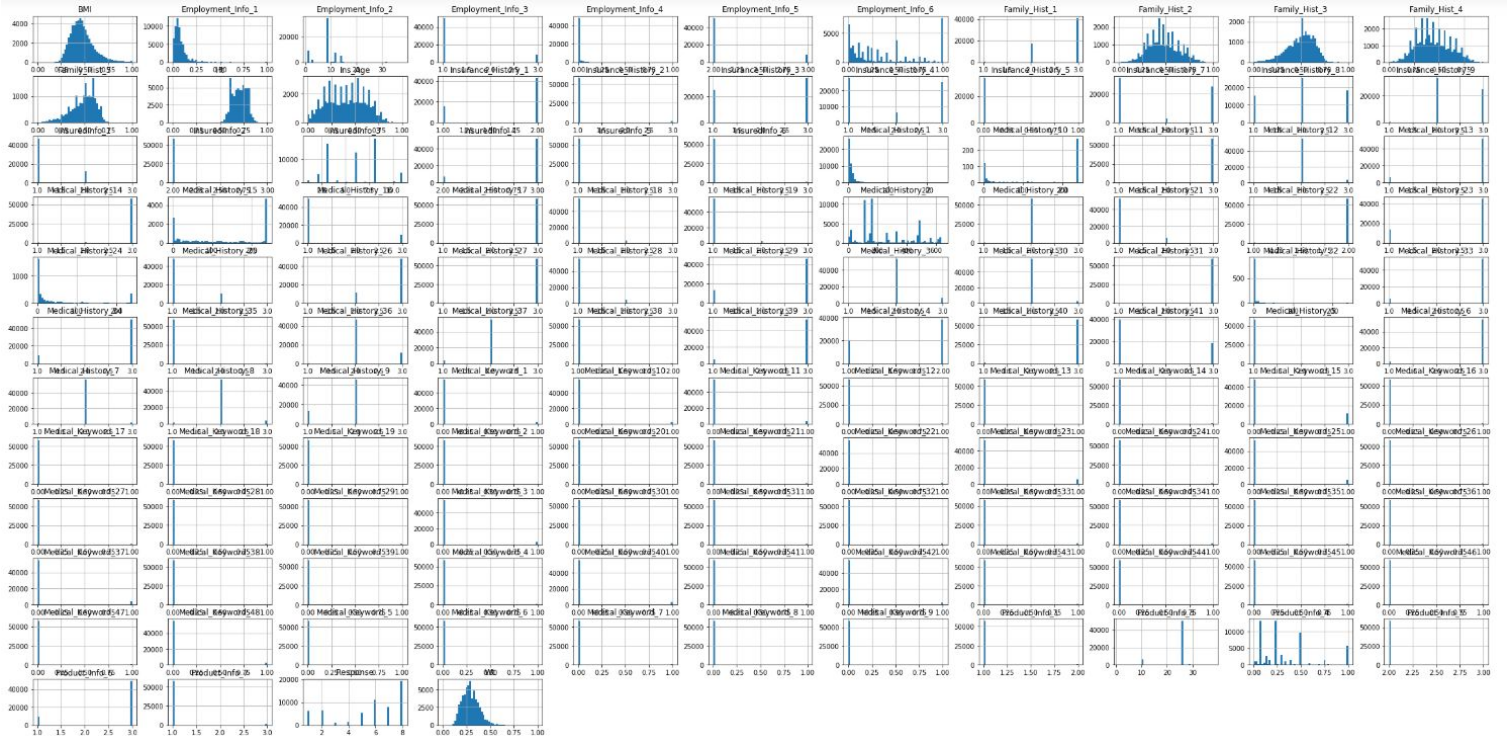


Le niveau de risque	Le taux
8	0.328238
6	0.189127
7	0.134950
2	0.110307
1	0.104584
5	0.091541
4	0.024116
3	0.017136

La variance pour les caractéristiques numériques :



La distribution des données :



D'après la table de variance et le diagramme de distribution, nous pouvons voir qu'il existe de nombreuses caractères avec une faible variance, les valeurs de ces caractères sont presque fixes, ce qui n'a aucun sens, nous pouvons supprimer certaines parmi eux.

Variable

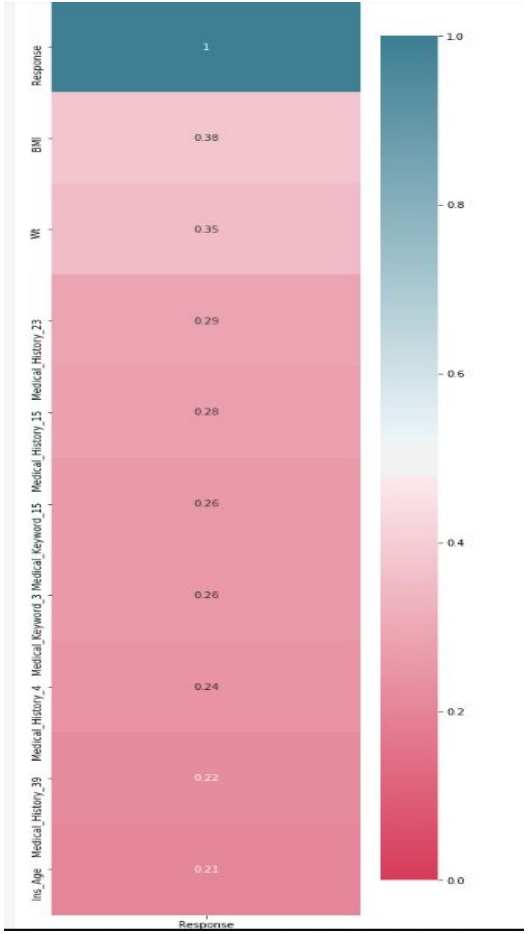
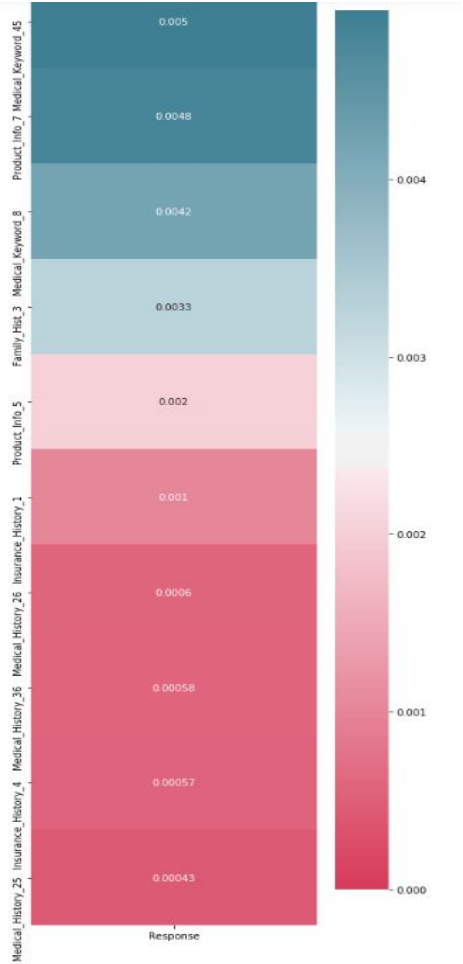
La corrélation entre la variable cible et les 10 valeurs les plus corrélés avec elle:



La corrélation entre la variable cible et les 10 valeurs les moins corrélés avec elle:



Traitement des données & Formation aux modèles

Traitement des données nécessaire:

1、Supprimer les lignes en double
2、Traitement de la valeur manquante
3、Numérisation des données
4、L'échantillonnage stratifié

Modèle de base : LinearSVC

Méthode utilisée :

1、Variable de contrôle
2、Rasoir d'Ockham
3、Validation croisée

Traitement de la valeur manquante

Qui remplacer ? et Comment ?

```
Parameters
----------
loss : {'deviance', 'exponential'}, optional (default='deviance')
    loss function to be optimized. 'deviance' refers to
    deviance (= logistic regression) for classification
    with probabilistic outputs. For loss 'exponential' gradient
    boosting recovers the AdaBoost algorithm.

learning_rate : float, optional (default=0.1)
    learning rate shrinks the contribution of each tree by `learning_rate`.
    There is a trade-off between learning_rate and n_estimators.

n_estimators : int (default=100)
    The number of boosting stages to perform. Gradient boosting
    is fairly robust to over-fitting so a large number usually
    results in better performance.

subsample : float, optional (default=1.0)
    The fraction of samples to be used for fitting the individual base
    learners. If smaller than 1.0 this results in Stochastic Gradient
    Boosting. `subsample` interacts with the parameter `n_estimators`.
    Choosing `subsample < 1.0` leads to a reduction of variance
    and an increase in bias.

criterion : string, optional (default="friedman_mse")
    The function to measure the quality of a split. Supported criteria
    are "friedman_mse" for the mean squared error with improvement
    score by Friedman, "mse" for mean squared error, and "mae" for
    the mean absolute error. The default value of "friedman_mse" is
    generally the best as it can provide a better approximation in
    some cases.

    .. versionadded:: 0.18

min_samples_split : int, float, optional (default=2)
    The minimum number of samples required to split an internal node:

    - If int, then consider `min_samples_split` as the minimum number.
    - If float, then `min_samples_split` is a fraction and
      `ceil(min_samples_split * n_samples)` are the minimum
      number of samples for each split.

    .. versionchanged:: 0.18
       Added float values for fractions.

min_samples_leaf : int, float, optional (default=1)
```

learning_rate=0.01,
n_estimators=1200,
max_depth=7,
min_samples_leaf=60,
min_samples_split=1200

```
Average prediction score: 0.6264816458570729
```
